We are surfers, always riding along the crest of the wave

To keep riding along the crest of the wave in our field is always mandatory to invest in innovation and research, operating with quality and professional seriousness.

That is what N.T.T. is trying to do since a long time. Thanks to skilled technicians with several years of experience in the

field, we have always accepted new and difficult technological challenges, imposed by the market for offering always-suitable technical solutions for our customer requirements. A great challenge has been the project of the AUSTRIAN company ASTA. Last year in July they asked us for preparing a project to enamel small flat wire (from 1 to 20 mm²), in a very short time. In fact, the deadline for starting the production was August of the next year.

It was an ambitious and a quite complex project, which required important modifications in the existing building and the installation of quite a lot of new equipments. Once we got the purchase order, the customer and N.T.T. technicians, worked together to design a new enameling plant suitable to satisfy their technical demands. Our mutual experience has enabled us to evolve our machine EVO FLAT 20, from the pay off devices to the take up units, with some unique technical innovations. To produce very small flat wire is not easy, than what we can imagine, and for this

reason a certain number of devices and controls have been implemented on the machine to avoid flat wire breaking or elongating during the process, with the machine in running condition.

From the design phase, the second step has been the machine manufacturing and finally the machine installation at the customer's premises. In a very narrow time frame, with some challenges, we successfully steered the project through, thanks to the full cooperation of ASTA technicians. The final result is represented by the scheduling compliance, such that, at the end of August 2015, all the machines were in production to the full satisfaction of the customer.

We are really proud of such a success and therefore hungry of innovation and ready to be involved in other new projects.

We are always at customer's disposal to create together with them new technical solutions for higher yield and lower production costs. We are convinced that only doing in this way, it will be possible to keep-up riding along the crest of the wave: just the way the surfers do!
